

Halden Distribution Ltd. — Service Level Agreement (SLA) policy

Purpose: define how quickly IT responds to and resolves support requests, so staff know what to expect and IT can be measured against a published target. **Owner:** IT (Muhammad Ibrahim Akmal) · **Approver:** Managing Director · **Review:** annually **Applies to:** all IT services in the [service catalogue](#)

This document defines **targets**. It does not report performance: actual SLA compliance is measured from real ticket data and is **not** stated anywhere until it has been measured (see `../docs/as-built.md` and the project README).

1. Where this applies

The SLA covers the services IT provides to Halden staff: the service desk itself, accounts and access, the shared drives, email and Microsoft 365, printing, the network and VPN, and the devices IT manages. It does **not** cover third-party services that fail outside IT's control (for example an ISP outage), although IT owns the communication and the escalation to the provider for those.

2. Business hours

The clock runs **Monday–Friday, 08:00–18:00 Asia/Karachi**, excluding public holidays. A request raised outside those hours starts its clock at the next opening time. This matters: an SLA defined as "4 hours" without a calendar is really an overnight commitment nobody intended.

Two measures are used:

- **TTO — Time To Own:** the time until a named person or team has taken the ticket and started work.
- **TTR — Time To Resolve:** the time until the ticket is resolved (fixed, or a workaround agreed

with the requester).

3. Priority and targets

Priority comes from Impact × Urgency, set by the desk at triage (and adjusted by the business rules). The user's own sense of urgency is an input, not the final word.

Priority	Impact × Urgency	Example	TTO	TTR
P1 Critical	High × High	Whole site down, ransomware, payroll-day failure	15 minutes	4 hours
P2 High	High × Medium	A department cannot work, VPN down for all remote users	1 hour	8 hours
P3 Medium	Medium × Medium	One user cannot work, a workaround exists	4 hours	2 business days
P4 Low	Low × Low	Service request or a cosmetic issue	1 business day	5 business days

The machine-readable targets and business rules live in `configs/glpi-sla-priorities.json`. The deadline arithmetic (weekend and holiday rollover) is proven by unit tests (`scripts/tests/test_sla.py`) so that "8 hours" is computed the way the policy says it is.

4. Escalation

A ticket is escalated automatically when **75% of its TTR has been used** without resolution: the L2 group is notified and the ticket is marked Escalated. Human escalation follows the [escalation matrix](#):

- **L1 IT Support** — first line: password resets, printers, BitLocker recovery, software requests, general triage.
- **L2 SysAdmin** — systems, AD/GPO, servers, network and VPN, security alerts.
- **L3 Vendor / MSP** — hardware warranty, ISP, firewall vendor, line-of-business application.

5. Rules the business rules enforce

1. **Security reports always go to L2** with priority P2, never left in the L1 queue.
2. **Payroll-day failures in Finance** are treated as P1 even if they look like a single-user fault.
3. **A failed or missed backup restore test** opens a P2 Backup ticket automatically.
4. **Recurring issues become problem records** — three or more tickets for the same fault triggers a problem record and a permanent fix, not a fourth workaround.

6. What the SLA does not promise

- A **fix** where the fault is with a third party — it promises ownership, communication and escalation, with the provider's own response governed by their contract.
- **Out-of-hours cover** — there is none in this model; P1 events outside business hours are handled on a best-effort basis and recorded as such. (If the business wants 24/7 cover, that is a separate decision with a cost.)
- **Restoring data beyond the backup window** — recovery is limited by the backup design (P8).

7. Review and reporting

Performance is reported monthly (volume, first-contact resolution, SLA compliance, top recurring issues). Targets are reviewed annually and whenever the business changes. ****No performance figure is published until it has been measured**** from real ticket data; the reporting definitions are in `p09-kpi-reporting.md`.

Business approval

Approver	Role	Date	Signature / approval
	Managing Director		
	IT Manager		

Status: drafted for the lab; **unsigned** until the business review actually happens.
