

Halden Distribution Ltd. — Restore-test register

Field	Value
Register ID	REG-RST-001
Owner	IT Lead
Maintained by	Automated weekly test, reviewed by the Service Desk
Purpose	The evidence that backups are periodically verified , as required by the backup policy and the backup/recovery job responsibility

This register is empty. No restore test has been run yet, so there is no history to publish. Fabricating weeks of "PASS" rows would breach the project's honesty rule (AGENTS.md R2). The rows below are the fixed **format**; the real rows are appended by `../scripts/06-Test-BackupRestore.sh` after each real run and copied here (sanitized) once they exist.

1. How a row is produced

- The weekly timer runs `06-Test-BackupRestore.sh` on BKP01 (Sunday, 05:00).
- It restores a sample of files and a virtual machine, checks hashes and service health, and writes:
 - `reports/restore-test-<date>-<host>.json` (machine-readable result)
 - an HTML summary for humans
 - one row in the history CSV (format below)
- It pushes the outcome to the monitoring system; a failure raises a high alert and a ticket.
- Once a quarter, the sanitized history is copied to `../evidence/public/` as evidence for the portfolio and for the monthly management report.

2. Register format (what a real row looks like)

Date	Host	Files tested	Files matched	Mismatches	Repository check	Duration (s)	Result	Reviewed by	Notes
(none yet)									

Rules for filling it in

- PASS** only when every sampled file hash-matched *and* the repository check passed. Anything else is **FAIL**.
- FAIL is reported, never suppressed.** A failed test is the most valuable row in the register, because it means the backups may not work.

- Duration is the measured restore duration for that test, in seconds.
- Notes record what was tested, what broke, and the ticket reference for any failure.

3. Targets for this register

Measure	Target	Basis
Tests run per year	52 (weekly)	Backup policy §8
Success rate	100% of scheduled tests passing	The "0" in 3-2-1-1-0
Consecutive passing weeks	12 consecutive weeks as the first milestone	Plan §Phase 3
Time to report a failure	Same day, as a high alert and a ticket	Backup policy §8

These are targets. The first achieved figures will appear in the rows above and in the measured performance table of `p08-service-levels.md`.

4. Empty template

The machine-readable empty template, with the exact column set the automated test produces, is `../data/p08-restore-test-history-template.csv`. It contains a header and no rows, by design.

Halden Distribution Ltd. is a fictional company. This register is a home-lab artifact; every row in it will come from a real run in the isolated lab.
