

Halden Distribution Ltd. — ITSM and service desk executive brief (1 page)

To: Managing Director and department heads · **From:** IT (Muhammad Ibrahim Akmal) **Date:** 2026-10-02
· **Subject:** A tracked, measurable IT support function for Halden

Halden Distribution Ltd. is the fictional company used in this portfolio. No figure in this brief is a measured result — the "after" column names the metric that will be reported once the system has run; the values are deliberately blank.

The problem today

Support requests arrive by email, Teams, WhatsApp and in person. Nothing is tracked, so we cannot say how many requests we get, what keeps breaking, or whether a user waits an hour or a week. Assets are recorded in a spreadsheet that no longer matches reality, and the firewall support contract expired without anyone noticing. When the previous IT person left, the documentation left with them.

What we are putting in place

- **One place to raise a request** — a self-service portal, with email and phone still accepted, and every request getting a reference number.
- **Published response and resolution targets** (SLAs) so staff know what to expect and IT can be measured against a target, on a business-hours calendar.
- **A clear escalation route** — first line, then Systems, then the supplier — with a handoff template so information is never lost between people.
- **An asset register that is reconciled weekly** against the network, so we know what we own and what is on the network.
- **A contract and licence register with renewal alerts** at 90 and 30 days, so no contract expires unnoticed and no licence is paid for and unused.
- **A documentation hub** where the as-built docs and runbooks live, with an owner and a review date on every page — knowledge that stays when a person leaves.
- **Configuration under version control:** server and firewall configuration is saved to a private repository every night, and a change with no approved record is flagged the next morning.

What it costs and what it saves

The software is free and open source (GLPI, BookStack, Uptime Kuma) and runs on one small existing server (OPS01). The saving is in the problems it prevents: an unnoticed contract renewal, an unmanaged device on the network, licence money spent on unused seats, and the time lost to work that is raised three times because nobody tracked the first attempt. The **licence right-sizing check** is the clearest early saving: seats paid for versus seats in use.

What we are asking the business to do

- 1. **Approve the service catalogue and the SLA targets** — these are business decisions (what we offer and how fast), not IT decisions.
- 1. **Nominate an approver per department** for access requests; access to data is approved by the data owner, not by IT.
- 1. **Ask staff to use the portal** for anything that is not work-stopping.
- 2. **Respond promptly to approval requests** on tickets — a waiting approval is a waiting user.

How we will report back

A monthly one-page report: tickets by category, first-contact resolution, SLA compliance, the top recurring issues and the permanent fixes agreed for them, plus upcoming contract and licence renewals. The first report will state a baseline; there is no meaningful "before" number today because nothing was tracked, and we will say so rather than invent one.

Metric	Before	After (to be measured)
Requests tracked per month	not tracked	—
SLA compliance	not measured	—
First-contact resolution	not measured	—
Assets reconciled (0 unknown-on-network)	spreadsheet, unreconciled	—
Renewals missed	at least one (firewall contract)	0 (target)

Status: drafted for the lab. The sign-off line below is **unsigned** until the business review actually happens.

Approver	Role	Date	Signature / approval
